

Scenario A — Carbon tax \$50/tCO₂: GIM agrees on emissions, adds the political-economy cost

What DICE models — and GIM reproduces

What DICE structurally cannot see

Dose-response: a channel DICE lacks

Anchor: Nordhaus, DICE-2016R (PNAS 2017) — optimal carbon price welfare-optimal, emissions decline; no unemployment / inflation / politics. Real reversals: France 2018 (gilets jaunes), Australia 2014. GIM adds the economy, society and policy chain that determines whether the tax survives.
